ASSESSMENT OF REGIONAL PROJECTS EFFICIENCY OF PUBLIC AND PRIVATE PARTNERSHIP

Abstract. The article presents the procedure for justifying the choice of public-private partnership (PPP) as a form of implementing an infrastructure project. However, its form and degree of elaboration differ significantly depending on the region. To date, there is practically no experience of applying such a procedure in the framework of the implementation of specific projects. The purpose of the article is to identify the features and basic elements of evaluating the effectiveness of regional projects of public-private partnership. To achieve the goal, the methods of abstract thinking, analysis and synthesis, monographic, sociological approaches were used; decomposition, comparative and system analysis, structural and functional approach to the study of conceptual grounds, the method of expert assessments. The analysis of scientific papers and publications in the field of implementation of public-private partnership projects made it possible to establish that given the rapid development of national PPP markets in the regions, as well as the growing demand for infrastructure cooperation between them, it seems appropriate to study the existing experience of evaluating PPP projects in the regional and global markets, practice, identify differences in approaches to such an assessment, and develop ways to synchronize and improve this procedure in the framework of economic growth. The article presents an approach to substantiate the comparative advantage of the PPP project. The current international practices of the PPP projects of the EAEU member countries are reviewed and the prospects for the development of assessment methods based on VfM criteria should be based on relevant indicators.

Keywords: state and private partnership, project, region, infrastructure.
